

FX Journal 1.0 — Premium User & Setup Guide

Your Complete Guide to SMC, ICT, and Portfolio Analytics Mastery

Thank you for purchasing **FX Journal 1.0**! This guide will walk you through the setup, features, and advanced analytical workflows of your new trading journal.

Unlike traditional journals that charge heavy monthly subscriptions, FX Journal 1.0 is **100% self-contained, offline-first, and local-first**. Your data belongs to you—it is stored securely in your browser's local cache, ensuring lightning-fast load times and absolute privacy.

1. Getting Started (Installation)

Getting started is extremely simple. There are no databases to configure or server dependencies to install.

How to Launch:

1. **Extract the files:** Unzip the folder you downloaded from Gumroad.
2. **Open the Journal:** Double-click the `index.html` file. It will automatically open in your default web browser (Chrome, Edge, Safari, Brave, or Firefox).
3. **Pin it:** We recommend adding the page to your browser's bookmarks bar (e.g., `Ctrl+D` or `Cmd+D`) for quick access at the start and end of every trading session.

2. App Setup & Navigation

The journal features a premium **Aero Frosted-Glass** interface designed to match state-of-the-art SaaS platforms.

Profile Customization:

- **Dark / Light Modes:** Click the sun/moon icon (🌙 / ☀️) in the top-right header to toggle themes. The Light Mode is styled with a soft, low-contrast "Slate Paper" look to reduce eye strain.
- **Theme Presets:** Head to the **Settings** tab (gear icon in sidebar) to select custom color presets:
 - **Midnight:** Deep navy/indigo.
 - **Forest:** Dark emerald.
 - **Sapphire:** Tech-blue with cyan glows.
 - **Obsidian:** Stealth-black theme.
- **Frosted-Glass Toggle:** Turn on *Aero Frosted Glass* in Settings to enable translucent cards with golden glows.
- **Web Audio Chimes:** Toggle *App Sound Effects* on or off. The journal synthesizes wave tones directly in your browser to chime on wins, losses, or account drawdowns.

3. Multi-Account Profile Setup

FX Journal 1.0 supports tracking multiple accounts simultaneously (e.g., your Live account, Demo account, and Prop Firm challenge).

1. Go to the **Settings** tab.
2. Under **Account Settings**, click **Manage Profiles**.
3. Create your custom account profiles (e.g., `My Exness Live`, `My FTMO 100K`).
4. Set a unique **Starting Balance** for each profile.
5. In the top-right header, select your active account from the dropdown. All dashboard stats, calendars, analytics charts, and logs will instantly filter and display metrics for that specific profile only.

4. Logging Your First Trade

To log a trade, switch to the **Trade Entry** tab:

1. **Details:** Enter the date, select the pair (e.g., XAUUSD, EURUSD), set the direction (Long/Short), and the active account.
2. **SMC/ICT Confluences:** Click on active setup confluences. These are critical for the *Leak Finder* analytics tool:
 - **HTF Bias:** Aligning with Higher Timeframe analysis.

- **OB Tap:** Orderblock tap.
 - **FVG Fill:** Fair Value Gap entry.
 - **BOS/MSS:** Break of Structure / Market Structure Shift.
 - **Liq Sweep:** Liquidity Sweep before entry.
 - **Killzone:** Trading inside active London/New York session windows.
 - **Overlap:** Multiple overlap levels.
 - **News Sweep:** Trading news-related liquidity sweeps.
3. **Metrics:** Input your Entry price, Stop Loss (SL), Take Profit (TP), Lot size, and Exit price.
 4. **Calculator Tool:** You can use the built-in risk calculator in the card header. Input your account balance, risk percentage, entry, and stop loss to instantly calculate your recommended lot size.
 5. **Screenshots:** Attach pre-trade or post-trade TradingView screenshot links. The system contains an auto-parser that will render chart previews inside your trade logs.
 6. **Psychology & Review:** Write down your pre-trade mental state, confluences, and post-trade reviews. Click **Save Trade**.

5. Trade Log & Scorecards

- **Expandable Logs:** Switch to the **Trade Log** tab. Click the small arrow (▶) next to the index number # of any trade row to slide open an inline details drawer. It shows screenshot previews, pre/post reviews, and active confluences.
- **Unified Daily Scorecard:** Found on the **Dashboard** tab.
 - Hovering over the  **Outlook** badge displays your pre-market bias and levels.
 - Hovering over the  **Review** badge displays a compilation of your post-market journal entry and individual outcomes of all trades taken on that day.
 - Clicking any row highlights it and opens the **Day Details Modal** where you can view, edit, or log new notes for that calendar date.

6. SMC/ICT Leak Finder & Analytics

Switch to the **Analytics** tab to get institutional-level insights into your edge:

1. **SMC/ICT Leak Finder:** Calculates your **Phantom PNL** (money lost on trades where a custom discipline mistake was flagged) and your **Potential Balance** (what your account would be worth if those mistakes were avoided).
2. **Confluence Performance:** Displays a win-rate tracker and visual progress bars for each logged confluence. This helps you identify which setups (e.g., OB Tap vs. FVG Fill) make you the most money.
3. **Advanced Expectancy Metrics:** Displays Sharpe Ratio, Expectancy, and Kelly Criterion to evaluate the mathematical edge of your trading strategy.

7. Strict Risk Management & Drawdown Lockout

The journal is programmed to act as your strict risk manager.

- **Daily Drawdown Limit:** Go to **Settings** and set your daily drawdown limit (e.g., 3% or 5%).
- **Discipline Lockout Mode:** When active, if your net losses for the day exceed your limit:
 - The dashboard will lock out.
 - An alarm chime will play.
 - You will be locked out from entering or editing trades for the remainder of the day to protect your capital.
 - You can toggle **Strict Mode** in Settings, which blocks manual lockout overrides for maximum self-discipline.

8. Backup, Cloud & Syncing

Because data is stored in the browser's local cache, clearing your browser cookies/history can wipe it. **You must back up your data regularly.**

Options for Backups:

1. **Local JSON Backup:** Go to the **Settings** tab -> **Data Center**. Click **Export Backup JSON** to save a complete file copy to your local drive. To restore it, click **Import Backup JSON** and upload the file.
2. **GitHub Gist Sync:** Configure your GitHub Username, Personal Access Token (Gist scope), and Gist ID in the Data Center to sync your journal files to a private GitHub Gist in 1 click.
3. **Google Drive Sync:** Authorize your Google account to back up and restore your journal configuration file directly to your personal Google Drive account.

9. Troubleshooting & FAQ

Q: I cleared my browser history and my trades disappeared. Can I get them back?

A: If you cleared your browser's "Local storage / cookies" and did not save a JSON backup or sync to GitHub/Google Drive, the data is permanently deleted. **Please make it a habit to export your JSON backup file at the end of every trading session.**

Q: How do I transfer my trading log to a new computer?

A: Export your data as a JSON file via the **Settings** tab on your old computer, transfer the file, open `index.html` on your new computer, and import the JSON file.

Q: The calculator is showing '—' instead of values. What's wrong?

A: Ensure you have selected a pair from the dropdown and entered both the Entry Price and Stop Loss. The calculator requires these values to compute pip ranges.

For support, inquiries, or custom upgrades, contact the project owner directly. Happy trading!
